

DVR Examiner 3.0

by DMEforensics

Developed by the developers

More. Easier. Faster

Specification Sheet

DVR Examiner requires certain specifications for optimal performance. The following are minimum required specifications.

- Windows 10, 10 Enterprise
- 16 GB RAM or more
- Dual Core Processor or better
- 1366x768 minimum recommended screen resolution

Notes:

Windows 7

Due to Microsoft no longer supporting Windows 7, DVR Examiner will not be supported on Windows 7 machines. While DVR Examiner may run and function normally on Windows 7, we cannot guarantee this. DVR Examiner requires certain certifications and Windows updates to perform, and most versions of Windows 7 will not have these requirements.

Windows Server

DVR Examiner requires the Windows Media Foundation to be installed. In many server installations this pack is not installed and DVR Examiner may not install or function properly. Windows provides server specific Media Foundation packs that can be installed on your server. If you are attempting to install DVR Examiner on a Windows Server machine, it is recommended to install Windows Media Foundation first.

Running DVR Examiner on a Non-Internet Connected PC

DVR Examiner can be run on both an internet connected and a non-internet connected PC. However, with new versions of DVR Examiner, it may be necessary to update Windows to get DVR Examiner to install and perform correctly. It is recommended to always keep Windows up to date, even on a non-internet connected PC. Please consult your IT department about keeping non-internet PCs up to date.
